

ABSTRACT OF THE DISCLOSURE

In Internet FAX communications, a CPU acquires a recipient mail address designated by a user or an originator mail address indicated in received mail.

5 The CPU then stores the acquired mail address in a recipient-address storage area or an originator-address storage area that is included in an information storage section. If any one of mail addresses stored in the recipient- or originator address storage area is

10 selectively designated when a recipient of the Internet FAX communications is designated, the CPU sets the selectively-designated mail address as a recipient address.
